

Opening the Binary Using IDA Pro

Name: Feras , Chuma

Objective

The goal of this task was to open a binary file using IDA Pro and analyze its contents to understand its architecture and see the disassembled code.

Steps

1. Opening IDA Pro

I opened IDA Pro and selected "Disassemble a new file" from the Quick Start menu.

2. Choosing the Binary File

I selected the file FM25V10-G@SOIC8 (2).BIN from my Desktop.

3. Load Settings

I loaded the file as a Binary file and chose MetaPC as the processor type. I also checked the options to create segments and load as code segment.

4. Selecting Disassembly Mode

IDA asked me to choose between 64-bit, 32-bit, and 16-bit mode. I selected 32-bit mode.

5. Entry Point Notification

Since this is a raw binary, IDA could not find the entry point. I received a message telling me to pick what looks like the start of code and press C to begin analysis.

6. Disassembly View

After loading, I could see the disassembled code in IDA. It showed assembly instructions like `inc ecx`, `add eax, [ecx]`, and one function named `nullsub_3`.

Conclusion

The file was identified as 32-bit, and I was able to see x86 assembly code and a function. This is useful for reverse engineering or firmware analysis.
